

Why revenue spiked over the weekend

Fri 26 – Sun 28 Jun 2026 vs same weekday prior week · Source: Daily MIS + 172k-row website line-item dump

The weekend was an **order-volume & conversion event — not a basket event**. ~50% more orders closed; that was **≈75% conversion lift** and **≈25% traffic**. **AOV and basket size did not move**. The campaign ignited demand via a near-universal free birthday gift + a heavy WhatsApp/Email/Push CRM blitz + scaled-yet-more-efficient paid media.

The data trap: The MIS shows units/order doubling 1.4 → 2.7. It's an artefact — the free gift is booked as a **₹0 line item**. Strip it out and **paid units/order is flat at ~1.5 all month**, spike days included. Revenue growth ≈ order growth, full stop.

The spike was conversion, not bigger baskets

Revenue = Sessions × Conversion × AOV · weekend vs prior weekend (+49.5%)

What moved the +49.5%

Sessions +10.8% · Orders/session +35.3% · AOV -0.6%.
1.108 × 1.353 × 0.994 = 1.49 ✓

SAME-WEEKDAY	PRIOR	CAMPAIGN	Δ
Sessions	640,653	710,109	+11%
Orders	3,222	4,830	+50%
Conversion	0.50%	0.68%	+35%
AOV	₹2,701	₹2,693	-0.6%

Why did conversion improve?

Hypothesis · evidence-backed

- Free “birthday gift with every order” offer & messaging — the single biggest changed variable. Gift attach went 19% → 99.9% of orders. 40–55%
- CRM blitz (WhatsApp O3+/O1, Push, Email) drove ₹1.16M click-through / 353 orders of warm, ready-to-buy intent. 20–30%
- Paid-media efficiency — Meta ROAS +24%, Google +33% at only +21% spend. Better offer converted the same clicks. 15–25%
- New premium SKU launches (Qi2 power-banks, 0 → ₹630k) gave high-AOV reasons to buy & qualify. 5–10%

Sub-drivers overlap — offer, CRM & paid jointly produced the conversion lift and can't be cleanly split without a holdout test.

How the campaign actually converted demand

Free-gift mechanic · ₹4,499 threshold bunching · category & channel winners

① Gift went universal

High

PERIOD	% ORDERS W/ GIFT
Jun 20–25 (₹4,499)	~19%
Fri Jun 26	79%
Sat Jun 27	99%
Sun Jun 28	99.9%

Repackaged from a threshold reward into a near-universal gift — a pure conversion lever (booked at ₹0).

② Threshold bunching

High

BASKET BAND	PRIOR	CAMP
₹4,000–4,498 (below)	166	74
₹4,499–4,999 ★ (above)	98	229
₹5,000–5,999	186	300

“Just-below” collapsed, “just-above” doubled — customers added items to qualify. Causal, not correlation.

③ Category winners

High

Wireless Charger	23%
Designer Cases	19%
Backpacks	8%
Organisers	7%
Phone Lanyards	7%

% of +₹4.31M growth. Power-banks (₹5–9k MagSafe Qi2, 3 new launches 0 → ₹631k) are the qualification engine.

Channel proof: Paid was scaled **and** got more efficient — Meta spend +21% → revenue +51% (ROAS 3.07 → 3.82); Google spend +22% → revenue +62% (ROAS 4.55 → 6.04). CRM (WhatsApp ROMS 3.2) primed the warm pools paid then retargeted. App sessions +28–33% (6–7× CVR).

Repeat the demand engine — fix the margin leak

✔ What worked — ranked

- **Universal “free birthday gift” offer + messaging** — biggest conversion lever.
- **CRM blitz** — WhatsApp O3+/O1 the workhorse (CTR 8–10%, ROMS 3.2); warm-intent fuel + paid amplifier.
- **More efficient paid media** — ROAS ↑ at scaled spend, not just bigger budgets.
- **₹4,499 threshold + new premium power-banks** — basket trade-up engine (~10–16% of growth).
- **Did NOT work as levers:** basket size, AOV, discounting — by design there was no sitewide discount.

Margin flag: a gift on **99.9%** of orders is unbudgeted COGS and kills the trade-up incentive. Re-gate it to a threshold.

🎂 Birthday Playbook + experiments

- **Keep the gift as a CVR device — but re-anchor to a threshold** (test ₹2,999 vs ₹4,499) so it lifts conversion *and* AOV.
- **Lead with WhatsApp O3+/O1** to warm audiences, then scale paid into proven demand. Cut Email-to-O1/RNB (11% open) & Push Mystery-Gift-2.
- **Time premium SKU launches just above the threshold**; add a “₹X more unlocks your gift” cart nudge.
- **Always report paid units/order & same-weekday** — never let ₹0 gift lines fake basket growth.

Next-sale tests: (1) geo/audience **holdout** to measure gift incrementality · (2) threshold A/B for the CVR-vs-AOV-vs-margin optimum · (3) CRM suppression holdout · (4) connect GA4 channel + funnel + user-type to close the New-vs-Returning / ATC-vs-checkout gaps.
